

Scenario:

You have a desk job and don't find much time to be active and workout. You are a person who is overweight and hates being overweight. You are using the Kitchen Manager app to help you lose weight by going on a diet.

Task 1: Look to see what your diet is for the day.

Task 2: Find how much fruit you have in your pantry.

Task 3: Create a list for when you go shopping later today.

Notes:

What changes would you make to your application (min 3 Things):

- 1) Make a back button for all the screens
- 2) Have screens for when the user clicks "Auto Grocery List", "Manual Grocery List", "Ate", "Bought", "Manual", "Shop Near Me", and "Settings"
- 3) When updating food, have the items go into a category like fruit, vegetables, meat, etc so when you search for food, you can just search the category
- 4) In the search bar, have a slightly faded "Search for food"
- 5) Have screen that appears once you click "My Diet Plan" that says "Create new Plan" and "View Current Plan"
- 6) Add color to the background

What you need to keep the same for your application (min 3 Things):

- 1) The screen when you start is very good except for the search bar critique that I had in the changes.
- 2) The size of everything seems appropriate
- 3) The starting screen has all the options that a user needs for the app.
